POWERDMARC

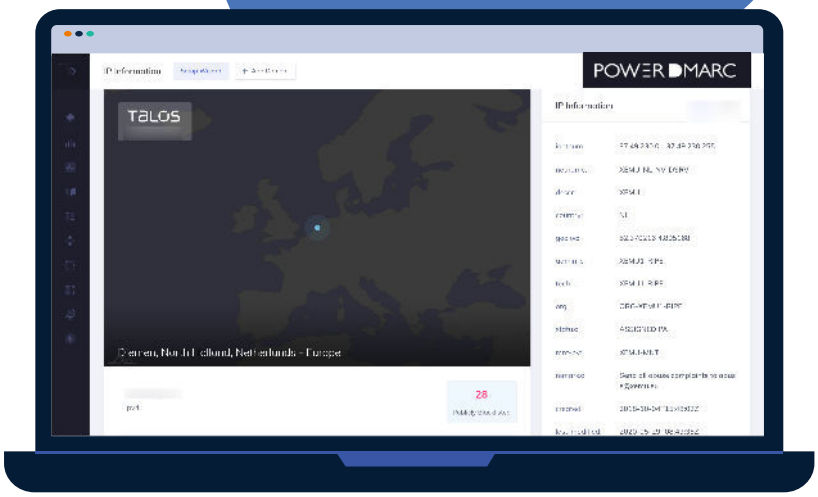
Datasheet

AI-Driven Threat Intelligence. For Details Too Small for the Human Eye

Beyond a point, it becomes impractical to monitor every single IP address that poses a spoofing threat to your domain. Not only do you need to know when a new malicious source pops up, but you **need to be alerted** when an attack is going on.

PowerDMARC's proprietary Threat Intelligence (TI) engine is your personal sentry on 24/7 guard duty. Our AI-based threat detection service uses specialized algorithms to rapidly identify the global blacklists on which each IP is located and the sending hostname's email reputation. All operating at a level of detail a human could never match.

How the TI Engine Takes Down Domain Spoofers



- Our systems find IP addresses that attempt to spoof your domain.
- Blacklisting Monitoring: Find out where the IP address or host name is blacklisted
- You get total visibility on the attacker, including their web host and history of domain abuse.
- As soon as they attempt domain spoofing, you get an alert in real time and see which IP address was responsible.
- With Power Take Down, you can report the IP and we'll have IP shut down in no time.

Behind the complex AI machinery are the many friendly, human faces of PowerDMARC. Why don't you **contact us** and find out how you can get your email secured today?
